

Abstract:

Environmental problems In the first place have to many detrimental consequences for human health. For this reason, public concern about environmental hazards is on the rise. The researchers believe that the best way to institutionalize of positive habits is the education specially from early childhood until these habits are become subjective beliefs. Then This research done to investigation of the effect of the educational intervention in knowledge of second highschool students in sib and sooran city located in Sistan and Baluchestan province, about natural resources. The statistical community of the present study was 1937 numbers from secondary high school students. 260 student were selected using Cochran formula randomly . finally, the scores of control and intervention groups toward students knowledge and attitude about natural resources issues were analyzed by T-test and pearson correlation. The results showed that the knowledge and attitude in educated group were higher than other groups and the education of natural resources issues can be a significant impact on the students knowledge and attitude level.
