Abstract

Small businesses, due to their importance in creating jobs and incomes and reducing unemployment (at the macro level), have highlighted the role of entrepreneurial foundations and organizations in the formation and reliability of these businesses. Therefore, this study was conducted to investigate the impact of entrepreneurial organizations and institutions in creating small businesses in the villages of the central part of Kalaleh city. This research is a descriptive-analytical method based on the study of library resources, documents and field studies. The statistical population of this study includes households living in villages in the central part of Kalaleh city. To determine the statistical sample size, Cochran model was used in which 30 villages and a sample of 384 heads of households (households living in villages in the central part of Kalaleh city) were selected and SPSS, Excel and GIS software were used to analyze the data. According to the results of the Pearson test of 0.498, it can be said that there is a significant relationship between the level of support for entrepreneurial organizations and the creation of small businesses. The results of regression test showed that the financial support index with a beta coefficient of 0.396 is the most important strategy of entrepreneurial organizations in creating small businesses in the villages of Kalaleh city. Also, the results of T-test of the sample obtained the average of the agricultural sector below the average and the industrial sector above the average, so the greatest success of entrepreneurial organizations in small businesses in the region in the agricultural sector is rejected.
